5 The invention is a reusable scent lure dispenser. One  
6 embodiment can be made of a variety of materials, large enough  
7 to throw, comprising two hemispherical body members, each  
8 having a planar flange extending along and attached to their  
9 outer periphery, a releasable means to couple the body members  
10 by their flanges, and a means along the flanges' outer  
11 peripheries to form an airtight seal against one another, one  
12 body member also having scent openings on its flange within  
13 the means to form an airtight seal, and can include a scent  
14 carrier disposed within the interior of one of the body  
15 members. The lure dispenser can be colored for various  
16 appropriate applications. Reflective material may be attached  
17 to the exposed surfaces of the hemispherical body members to  
18 allow easy retrieval at night. A tab with a mounting hole can  
19 allow easy hanging, such as in a tree.
